

PROJECT DOCUMENTATION

Auto Classify School IT Tickets

ServiceNow Flow Designer Automation Project

Project	Auto Classify School IT Tickets
Platform	ServiceNow
Technology	Flow Designer
Application Area	IT Service Management / Ticket Classification
Repository	auto-classify-school-it-tickets

1. Project Overview

Auto Classify School IT Tickets is a ServiceNow automation project developed using Flow Designer. The purpose of the project is to reduce manual effort in classifying school IT support tickets. The flow reads the ticket's Short Description, evaluates predefined conditions, and updates the appropriate category and subcategory for the incident.

2. Problem Statement

IT support teams receive tickets describing different types of technical problems such as network issues, hardware or projector problems, password issues, and performance issues. Manual classification can take additional time and may lead to inconsistent categorization. This project automates the initial classification step using ServiceNow Flow Designer.

3. Objectives

- Automatically process newly created IT tickets.
- Analyze the Short Description of each ticket.
- Identify the relevant issue category using conditional logic.
- Update the incident record with the appropriate category/subcategory.
- Demonstrate successful execution through Flow Designer test results.

4. Technologies Used

Technology	Purpose
ServiceNow	Platform used to create and manage the ticket workflow.
Flow Designer	Creates the trigger, conditions, and update actions.
Incident / Custom Table	Stores the ticket information and classification result.
Conditional Logic	Matches ticket descriptions to classification rules.

5. Workflow Design

The flow follows a simple classification pipeline:

Ticket Created → Read Short Description → Evaluate Conditions → Update Record → Classified Incident

The conditions are configured using the Short Description field. The matching rule uses text matching such as 'contains' so that descriptions such as 'Network Issue' can be classified under the appropriate network category.

6. Classification Logic

Input / Keyword	Classification
WiFi / Network	Network
Projector / Hardware	Hardware
Password	Password-related category
Performance	Performance

7. Test Execution

The flow was tested using a sample incident. During the successful test run, the relevant condition was evaluated as True and the corresponding Update Record action completed successfully. The other branches were not executed, which is expected because only the matching classification branch should run.

8. Sample Result

Field	Sample Value
Incident Number	INC0001005
Caller	Abraham Lincoln
Short Description	Network Issue
Category	Network
Subcategory	Wi-Fi

The sample result demonstrates that the input 'Network Issue' was successfully classified as Category: Network and Subcategory: Wi-Fi.

9. Verification Evidence

The following screenshots can be included with the project submission as supporting evidence:

1. Flow Designer showing the complete Auto Classify School IT Tickets flow.
2. Flow execution showing 'Evaluated - True' and 'Core Action - Completed'.
3. Incident workflow records list showing INC0001005 with Network and Wi-Fi classification.

10. Expected Benefits

- Reduces manual ticket classification effort.
- Provides consistent classification based on predefined rules.
- Makes the workflow easier to demonstrate and verify.
- Provides a foundation for adding more categories and rules in the future.

11. Future Enhancements

Future versions can include more classification keywords, additional ticket categories, assignment group routing, priority determination, notifications, and AI-assisted ticket classification.

12. Conclusion

The Auto Classify School IT Tickets project demonstrates how ServiceNow Flow Designer can automate ticket classification. The implemented flow successfully evaluates ticket descriptions and updates the corresponding incident record. The successful test execution and classified incident record provide evidence that the workflow is functioning as intended.
